**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b> 10/593,730	<b>Applicant(s)</b> BERTHOLD ET AL.	
	<b>Examiner</b> HYUN PARK	<b>Art Unit</b> 2863	

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 31 March 2010.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 12-23 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 12-23 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 21 September 2006 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All    b) ☐ Some \*    c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## **DETAILED ACTION**

**Regarding Claims:** 1-11 Cancelled.

### ***Claim Rejections - 35 USC § 101***

1. Previous rejection is withdrawn in view of the Applicant's amendment filed on 03/31/2010.

### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 2863

4. Claims 12-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Smith, "Understanding Parameters Influencing Tire Modeling,") (hereinafter Smith) in view of Ono et al., US-PGPUB, 2004/0133330 (hereinafter Ono).

**Regarding Claim: 12.** Smith discloses a method for calculating the lateral force in a motor vehicle with an electromechanical or electrohydraulic steering system, the method comprising:

calculating a total restoring torque from the steering rod force, with the said restoring torque comprising a restoring torque generated by lateral force and other restoring torques; quantitatively determining the other restoring torques based on measured values, and subtracting the other restoring torques from the total restoring torque for determining the restoring torque generated by the lateral force, (pg. 7, "Self-Aligning Torque" section).

----- newly added portion to clarify earlier rejection-----

NOTE: The first paragraph in "Self-aligning Torque," section discloses the well known fact that the self-aligning torque is influenced not only by the lateral force, but also by a mechanical trail induced from suspension geometry. For example, some of the other torque maybe from caster and kingpin offset, as well as camber. Stated mathematically, Total Self-Aligning (Torque) = Torque (lateral forces) + Torque (caster) + Torque

Art Unit: 2863

(kingpin offset) + Torque (camber). Unlike the Applicant however, Smith just happens to use only the torque due to lateral forces, but this does not nullify the well known fact that self-aligning torque is due to several different types of torque. Having the Total Self-Aligning Torque equation, then it is only a matter of simple algebraic manipulation, namely subtraction, to find the torque due to the lateral forces. The equation 20 is just showing the relationship between the torque and the lateral forces. As such, it would have been obvious to a person of ordinary skill in the art at the time of the invention to use the said equation to find the lateral force, once the torque value is known, since this also requires only a routine skill in the art.

-----

Smith does not disclose recording a steering rod force;

Ono discloses self-aligning torque calculating apparatus, which consists of the steering torque (or force) detection portion, which is used to accurately determine one of the parameter (namely the surface friction state) related to the stability of the vehicle (*Fig. 2; Paragraph [0007]*)

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use Ono's self-aligning torque apparatus and method, which includes the Steering Torque detection portion (**21**; *Fig. 2*) in the method of Smith to accurately

Art Unit: 2863

record the steering torque as taught by Ono, and thereby accurately calculate the lateral force in the determination of optimal vehicle stability and control.

**Regarding Claim: 13-14.** Smith discloses a transmission ratio (which is responsive to a steering angle) between the steering rod force and the total restoring torque is included in the determination of the lateral force (*pg. 7, "Pneumatic Trail," section, Equations 22-23*).

**Regarding Claim: 15.** Smith discloses a kingpin inclination, a caster angle or a combination thereof (*pgs. 6-7, "Self-aligning" section*).

Although the parameters kingpin inclination and caster angle are not included in the self-aligning torque and lateral force approximate calculations of Smith, it would have been obvious to a person of ordinary skill in the art to include the said parameter in the calculation of the lateral force with greater accuracy since these are well known parameters related to the lateral force and consequently the stability and control of the vehicle.

**Regarding Claim: 16.** Smith discloses the other restoring torques comprise one or more of a restoring torque generated by a vertical force (*pg. 7, "Self-Aligning Torque," section, Equation 21*).

Art Unit: 2863

**Regarding Claims: 17-19.** Smith does not disclose the total steering rod force is calculated from a steering torque generated by the driver, a steering amplification, and a steering ratio

Ono discloses the total steering rod force is calculated from a steering torque generated by the driver, a steering amplification, and a steering ratio (Fig. 2; *Paragraph [0033]; power steering device is the steering with amplification, and the steering torque is inherently generated by the driver and a steering-angle-responsive steering ratio*)

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use Ono's self-aligning torque apparatus and method, which includes a total steering rod force (or torque) generated by the driver, a steering amplification, and a steering ratio, in the method of Smith to accurately record the steering torque as taught by Ono, and thereby accurately calculate the lateral force in the determination of optimal vehicle stability and control.

**Regarding Claim: 20.** Smith does not disclose the total steering rod force is determined from the motor current and/or the motor position of one or more electric motors of the electromechanical or electrohydraulic steering system

Art Unit: 2863

Ono discloses total steering rod force (or torque) determined from the motor current and/or the motor position of one or more electric motors of the electromechanical or electrohydraulic steering system (*Fig. 2; Paragraph [0027]*).

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use Ono's self-aligning torque apparatus and method, which includes the total steering rod force (or torque) determined from the motor current and/or the motor position of one or more electric motors of the electromechanical or electrohydraulic steering system, in the method of Smith to accurately record the steering torque as taught by Ono, and thereby accurately calculate the lateral force in the determination of optimal vehicle stability and control.

**Regarding Claim: 21.** Smith discloses determining sideslip angle from the determined lateral force (*pgs. 3-4, "Slip Angle," section, Equations 2 and 4; pg. 6, "Total Lateral Force" subsection*).

**Regarding Claim: 22.** Smith does not disclose coefficient of friction being determined from the determined lateral force.

Ono discloses calculating coefficient of friction (*Fig. 2*).

Art Unit: 2863

At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use Ono's self-aligning torque apparatus and method in the method of Smith to accurately calculate the coefficient of friction as taught by Ono.

**Regarding Claim: 23.** Although Smith does not disclose the steps of outputting the lateral force to a dynamic control system of the vehicle that is configured to check and limit yaw movement of the vehicle based upon the lateral force, it would have been obvious to a person of ordinary skill in the art at the time of the invention to output the lateral force to a said dynamic control system, since it is well known that many up-to-date motor vehicles are equipped with the said dynamic control system configured to check and limit yaw movement of the vehicle to ensure safety of the vehicle and lateral force is also a well known variable related to the dynamic performance of the vehicle, as stated even by the Applicant (*Background of the Invention* section, Paragraph [0005]).

### ***Response to Arguments***

5. This Office Action is made 2<sup>nd</sup> Non-final to clarify earlier rejection.
6. Examiner has clarified the previous rejection, and the argument can be seen above in Claim 12, under " ---- *newly added portion to clarify earlier rejection*----".

***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to HYUN PARK whose telephone number is (571)270-7922. The examiner can normally be reached on 8-4 PM, M-Th.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Drew Dunn can be reached on (571)272-2312. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
